SDN-IP
VPLS
Carrier Ethernet 2.0
L3VPN

Logically Centralized Control

1. Optimize resource usage
2. Dynamic traffic provisioning
3. Multi-layer resiliency

Disaggregated Transport Network

1. Reduces CAPEX & OPEX
2. Eliminates vendor lock-in
3. Allows rightsizing and piece-wise upgrades

Service Providers

Tier 1 Vendors

Tier 2 Vendors

Without OLS Controller

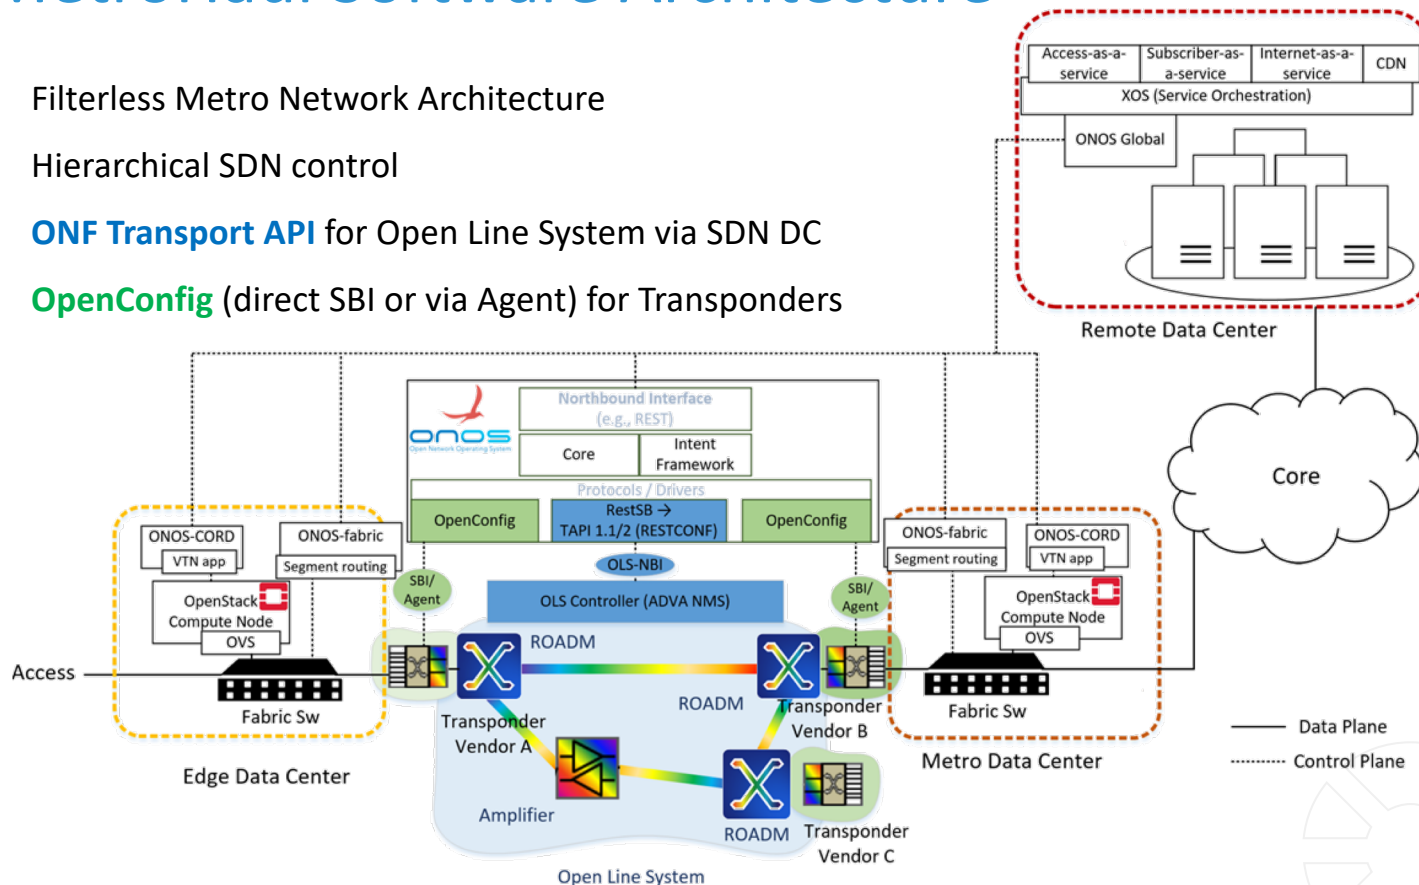

With OLS Controller

4

MetroHaul Software Architecture

- Filterless Metro Network Architecture
- Hierarchical SDN control
- **ONF Transport API** for Open Line System via SDN DC
- **OpenConfig** (direct SBI or via Agent) for Transponders

<https://metro-haul.eu>

SENDATE Multivendor optical SDN Trial (09/2018)

Open Disaggregated SDN Control Architecture

- Multivendor trial including Network orchestration layer, Control and management layer and Infrastructure layer.
- Layered approach based on ONF Transport API 2.0 with extensions for Optical Performance Planning

Network Orchestration layer components include:

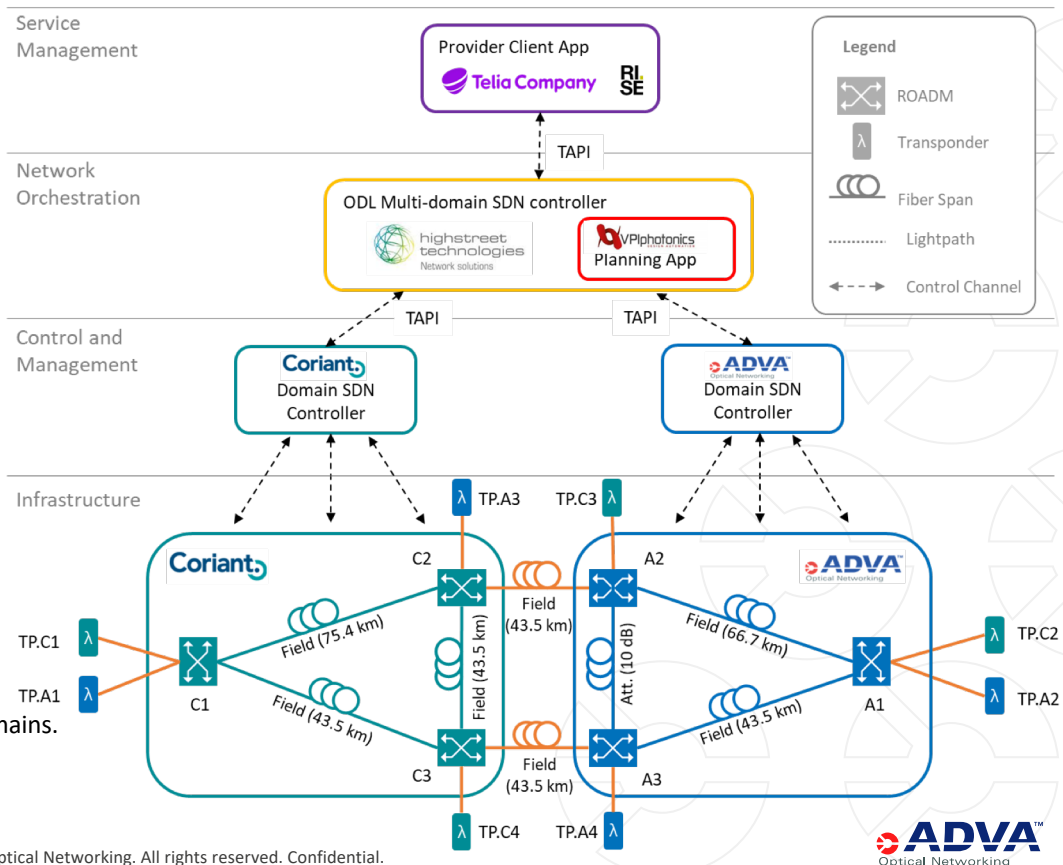

- Transport Orchestrator (Highstreet technologies)
- Planning Application (VPIphotonics)
(Bundled in Transport Orchestrator)

Control and Management layer:

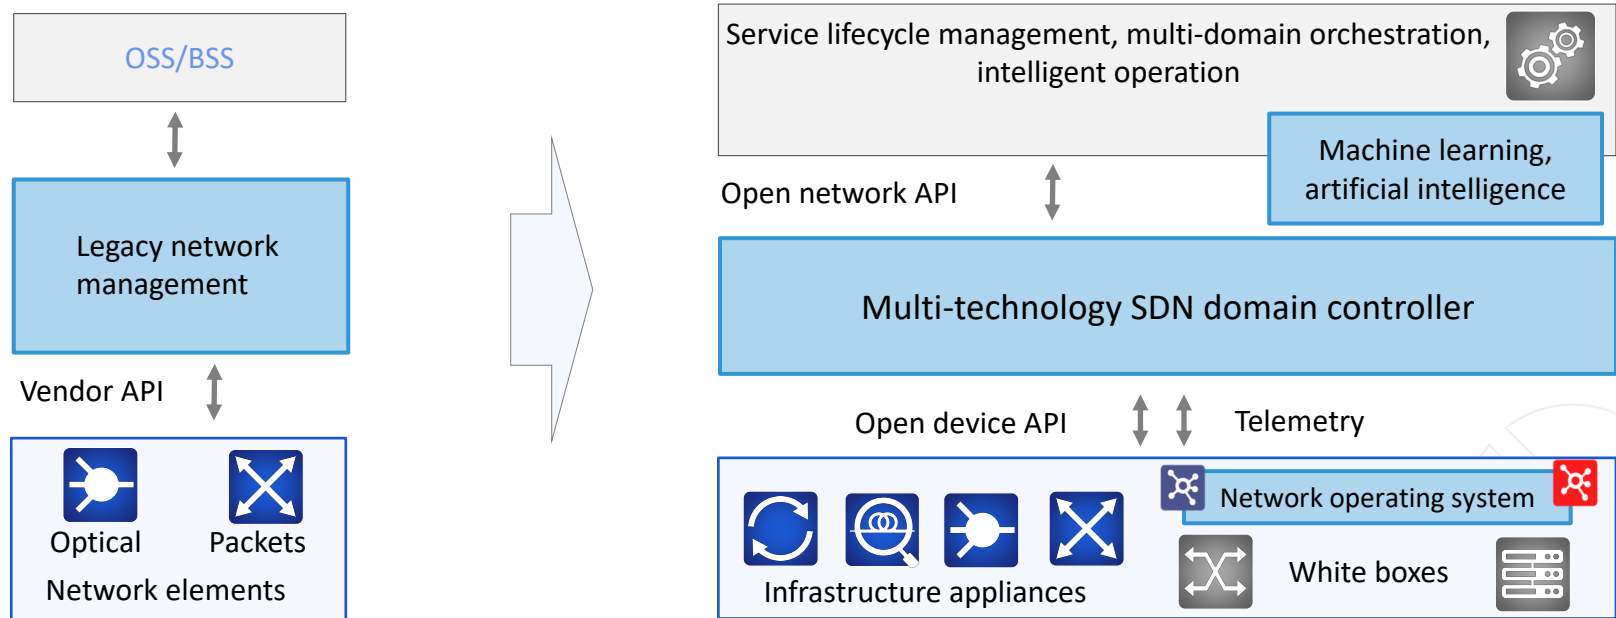

- SDN Domain Controllers (ADVA and Coriant)

Infrastructure layer:

- ROADMs and transponders (ADVA and Coriant)
- Transparent OMS back-to-back ROADM interconnect
- Alien wavelength interconnection passing both vendors optical domains.

Rearchitected network control... towards Autonomy

AI/ML example : capacity optimization

- Neural networks
- 9 input features, 1 output feature (OSNR)
- 2 hidden layers (120x100 neurons)
- ReLu activation function

Split entire dataset

Build ML model using
train/validate

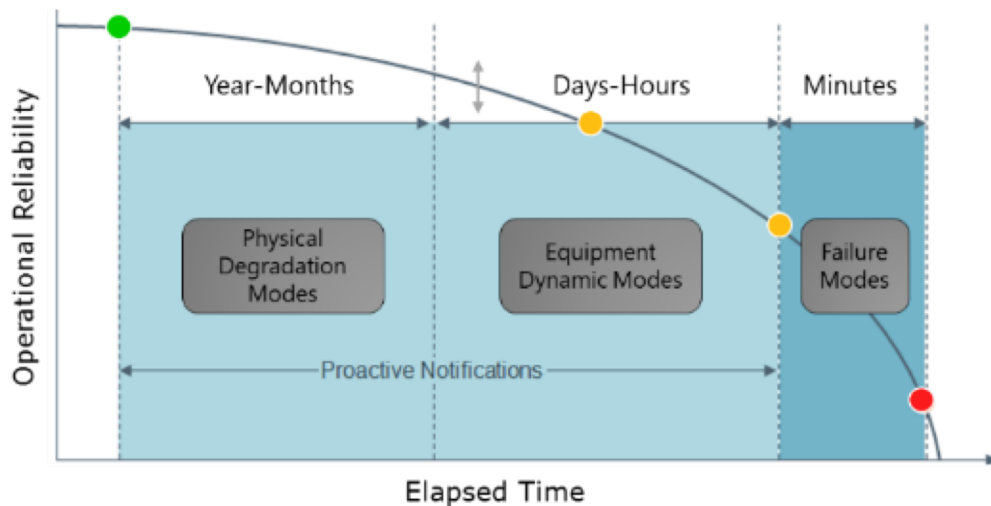

Get test data, and remove
true OSNR values

Apply ML model (Get
predicted OSNR values)

Compare True OSNR vs.
Predicted OSNR

Prediction of OSNR with ~0.04dB mean accuracy

AI/ML example: predictive maintenance

Colored lines
detected by ML
(Jan 6th)

Precise
prediction
verified

Improving availability and faster repair cycles by predicting device outages
